

## МИНИСТЕРСТВО ОБРАЗОВАНИЯ И НАУКИ КЫРГЫЗСКОЙ РЕСПУБЛИКИ КЫРГЫЗСКИЙ ЭКОНОМИЧЕСКИЙ УНИВЕРСИТЕТ

им. М.Рыскулбекова

#### *Name of discipline and code : B.2.1. Mathematics*

Lecturer	Alapaeva Asel Aidarkulovna
The contact information:	Phone number: mob. 0776786708
Amount of credits:	5
Date:	1-semester 2019-2020 education year
Purpose and	7. Objectives:
objectives of the	The primary objectives of this course are:
course	• to develop abstract and logical (probative) thinking,
	• understanding how to set and solve problems,
	• acquiring as basic knowledge of linear algebra and analytic geometry,
	• appreciating the value of continued mathematical education for the major.
	To achieve these objectives, in the course of studying the course "Mathematics", the problem of providing a broad, general and sufficiently fundamental mathematical education for students of economic direction is being solved. Fundamental preparation includes a sufficient generality of mathematical concepts and constructions, providing a wide range of their applicability, reasonable accuracy of formulations of mathematical properties of the objects under study, logical rigor of the presentation of the subject, based on an adequate modern mathematical language.
Course Description	Mathematics is a two-semester course for the first year students studying at KEU. This course is an important part of the bachelor stage in education of the future economists. It has give students skills for implementation of the mathematical knowledge and expertise to the problems of economics. Its prerequisites are both the knowledge of the single variable calculus and the foundations of linear algebra and analytic geometry including operations on matrices and the general theory of systems of simultaneous linear equations, vector algebra, introduction to mathematical analysis, differential calculus of functions of one variable,
	study of functions using a derivative, indefinite integral, definite integral and its applications, functions of several variables, differential equations. The course is taught in English.
Prerequisites disciplines	The school course of algebra and the beginning of analysis; the school course of geometry.
Post-requisition	Basic and special. course subjects
discipline Competencies	<ul> <li>As a result of mastering the discipline, a bachelor must know:</li> <li>basic concepts of linear and vector algebra (matrices, determinants, vectors, scalar, vector and mixed products of vectors, etc.)</li> <li>basic concepts and problems of analytic geometry (line on the plane, space, curves of the second order)</li> </ul>
	<ul> <li>basic concepts and methods of differential and integral calculu</li> </ul>

	(limit, derivative, differential of a function of one and several								
	variables, extrema of functions, etc.);								
	<ul> <li>basic types of ordinary differential equations and methods for their solutions.</li> </ul>								
	To be able to:								
	• Develop the algebraic skills necessary for problem solving.								
	• Develop the ability to model linear, quadratic, and other								
	nonlinear relations, including the use of the graphing techniques								
	and geometrical principles as tools, for the purpose of solving real-world problems.								
	• Understand basic matrix operations and solve systems of linear equations.								
	• Formulate and apply an equation, inequality or system of linear equations to a contextual (real-world) situation.								
	• Determine equations of lines, including point-slope, slope- intercept forms and parametric and symmetric equations.								
	• Understand two- and three dimensional vectors and solve the								
	problems.								
	Use:								
	<ul> <li>methods of solving problems of differential, integral calculus;</li> <li>numerical methods of solution;</li> </ul>								
	<ul> <li>methods of constructing a mathematical model of professional</li> </ul>								
	problems and a meaningful interpretation of the results obtained.								
Course Policy	Students will be advised whether calculators are needed for specific								
	assignments								
	Do not be late for classes								
	Do not skip classes, in case of illness, provide a certificate If the tasks are not fulfilled, the assessment is reduced Actively participate in the educational process								
	Actively participate in the educational process Timely and diligently to do homework								
	Be tolerant, open and friendly to fellow students and teachers								
	Constructively support feedback in all classes								
	Be punctual and compulsory								
	Active method passive method interactive method								
Teaching methods:	Active method, passive method, interactive method								
Form of knowledge	Assessment of knowledge will be conducted on the basis of the								
control	European ECTS system. The ECTS system initially divides students								
	between the theses "credits", "not credits", and then assesses the work of								
	these two groups separately.								
	Students who score more than 50 points receive a "pass" rating. "Excellent" (from 85 to 100 points), "good" (from 70 to 84 points),								
	"satisfactory" (from 50 to 69 points).								
	The points of the final evaluation are distributed as follows:								
	Current control work (max) -40 points								
	Border control work (max) -40 points								
	Final control (written examination max) -20 points								
	At deducing of a total estimation activity of students in the decision of the problems offered on employment will be considered								
	<ul><li>the problems offered on employment will be considered.</li><li>The current test (homework) is necessary to consolidate the material</li></ul>								
	studied, as well as to check the level of understanding of the material.								
L									

	Homework will contain calculation tasks that use basic facts and statements. Doing homework will give students the opportunity to									
	understand the material they have passed.									
	• Border testing is given to check knowledge of current materials. We									
	will propose computational tasks, as well as theoretical tasks that reveal									
	an understanding of the basic definitions. Correct execution of tests will									
	-									
	give students a chance to gain high credit marks. One of the basic									
	conditions for recruitment of high scores is the student's possession of									
	the material he has passed at a sufficiently high level. Test works will be									
	held at the set time. Retake of control works is not provided.									
	• Final control is a written examination. After receiving the exam ticket,									
	the student must write down the answers to exam questions in writi In order that students can properly prepare for the exam, a list of ex									
	questions is given in advance. The answer is considered best if the									
	theoretical facts are illustrated by concrete examples.

	<ul> <li>b) the scalar product of the vector d by the vector f;</li> <li>c) the length of the vectors d and f</li> <li>2. Compose the simplest equation of the hyperbola if the distance between its vertices is 30, and the distance between the foci is 40.</li> <li>3. Write the equation of the circle with the center at the point C (5, -4) and the radius equal to 7.</li> <li>4. Find the lengths of the axes, the coordinates of the foci, and the eccentricity of the ellipse 9x<sup>2</sup> + 16y<sup>2</sup> = 196.</li> <li>5. The straight line ℓ<sub>1</sub> has the equation 6y-4x-3 = 0, the straight line is the equation 2y-40x + 7 = 0, the straight line is the equation 18y-17x + 51 = 0. Which of these lines goes up faster than everyone. Draw the graphs of these lines in one coordinate system.</li> <li>6. Find the equation of a straight line passing through the point (1,2) and parallel to the line 4x + 12y + 3 = 0. Draw the graphs.</li> <li>7. Find the equation of the straight line passing through the point (6, -3) and perpendicular to the line x-3y + 12 = 0. Draw the graphs.</li> </ul>
Note	Homework should be presented in the exact time set by the teacher. In the case of delivery of work after a fixed period, 50% of the points received by the student for work are removed.
